

2019 PERFORMANCE MEASURE UPDATE

Objective 1A

PM1

Regional Vehicle Connectivity

Our regional road network should make it possible to move between key locations in a reasonable amount of time. This measure identifies those key locations, then calculates the average vehicle travel time during the morning peak travel period.

Data

25.4

AVERAGE MINUTES OF TRAVEL TIME DURING PEAK MORNING TRAFFIC BETWEEN ACTIVITY CENTERS

How is it Measured?

Step 1
Identify regional centers

Step 2
For each center, measure travel time to all others

Step 3. Repeat for all centers; average all times

Objective 1B

PM1

Percentage of People in the Region with Access to a Connected Bikeway

Access to a bikeway allows more people to bike safely for commuting or recreation. Connected bikeway networks allow people to travel further by bike. Access is defined as residents that live within a 1/2 mile of a connected bikeway.

Data

48%

OF THE REGIONAL POPULATION HAS ACCESS TO A CONNECTED BIKEWAY

How is it Measured?

Connected bikeways are those where two or more bikeways cross, creating connections. This measure divides the number of people who live within 1/2 mile of the most-connected bikeways by the number of people in the Metropolitan Planning Area.

Objective 1B

PM2

Percentage of People in the Region with Access to a Sidewalk

Sidewalks help people move around neighborhoods, access transit, and stay healthy. They are important for people with disabilities, older residents, and children to be comfortable and safe walking. Access is defined as living within 200 feet of a sidewalk.

Data

49%
OF THE REGIONAL POPULATION
HAVE ACCESS TO A SIDEWALK

How is it Measured?

This measure divides the number of people who live within 200 feet of a sidewalk by the number of people in the Metropolitan Planning Area.

Objective 1C

PM1

Transit Ridership Per Capita

Transit systems are one of many transportation choices. The higher the number of transit trips per person in a population, the better the access and convenience of the transit system. This measure includes unlinked transit trips taken on IndyGo's and Access Johnson County's fixed-route and paratransit (demand response) services.

Data

5.2
TRANSIT TRIPS PER PERSON (2017)

How is it Measured?

Step 1

Transit providers count every passenger that boards a vehicle.

8-COUNTY

Step 2

The rider counts are divided by population estimates for the 8-county region (from ESRI Community Analyst).

Objective 1C

PM2

Percentage of People in the Region with Access to Fixed-Route Transit

Scheduled, fixed-route transit provides a transportation option for people who can access it. Transit service (frequency/hours/etc.) may improve as the number of people who can access them and use them increases. Ten minutes is considered the maximum time people are willing to walk to a transit stop (~1/2 mile).

Data

31.4%
OF THE REGIONAL POPULATION HAS ACCESS TO FIXED-ROUTE TRANSIT

How is it Measured?

MPA

Step 1
A 1/2 mile buffer is drawn around fixed-route transit lines. People in the buffer have access to transit. ESRI Community Analyst estimates the population within the bus stop buffer.

Step 2
The number of people within the buffer is divided by population estimates for the MPA (from ESRI Community Analyst).

Objective 1C

PM3

Transit Ridership Per Capita along Frequent Transit Routes

Frequent transit route are those with buses coming every 15 minutes or less. These routes often have higher ridership than others because riders do not need a schedule to know that the next bus will come "soon".

Data

15.3
TRANSIT TRIPS PER PERSON ALONG FREQUENT TRANSIT ROUTES (2017)

How is it Measured?

MPA

Step 1
Transit providers count every passenger that boards a bus on the high frequency routes.

Step 2
A 1/2 mile buffer is drawn around fixed-route transit lines.

Step 3
The rider counts are divided by population estimates for the buffer (from ESRI Community Analyst).

Objective 3A

PM1

Transportation Costs as a Percent of Median Income

Transportation costs are the second largest expense in a household and where a person chooses to live, along with the transportation options available at that location, are important determinants for transportation costs. Transportation costs are considered affordable when they are less than 15 percent of a household's income. By tracking transportation costs, we understand the burden the existing transportation system places on individual households.

Data

How is it measured?

**Auto
Ownership**

**Auto
Use**

**Transit
Use**

The Housing and Transportation (H+T) Affordability Index uses three elements in their transportation costs model.

The estimate of transportation costs is divided by the median household income within the MPO's metropolitan planning area.

Objective 3B

PM2

Equity Accessibility Gap

Accessibility to jobs is one of the key functions of the transportation system. In the region more than 90% of the population has access to a vehicle, including the equity population. In measuring the gap in accessibility to jobs between the equity population (low income and non-white and/or Hispanic) and the white, non-Hispanic population we considered access to jobs within a 30 minute drive between zones. Documenting the gap in access will allow the MPO to determine, over time, if transportation investments are improving access to jobs for the equity population relative to the non-equity population. The measure uses the Environmental Justice areas identified by the MPO aligned to Traffic Analysis Zone (TAZ) for determining the accessibility gap.

Data

How is it Measured?

Step 1
Identify equity zones and non-equity zones. Identify zones with jobs

Step 3. Separate equity zones from non-equity zones

Step 2
Measure travel time between zones, selecting travel times under 30 min

Objective 3C

PM1

Percent of Environmental Justice Population Near Frequent Transit

This is a measure of the percentage of the environmental justice population that can access frequent transit routes. "Frequent transit" is a fixed-route transit line where the bus comes every 15 minutes or less. "Environmental Justice Population" includes all non-white or Hispanic people and people (by household) living in poverty. "Access" means within walking distance of a stop on a frequent transit route, which is defined as a 10 minute walk (1/2 mile).

Data

**NON-WHITE / HISPANIC
POPULATION WITH
FREQUENT TRANSIT ACCESS**

13%

**HOUSEHOLDS IN
POVERTY WITH FREQUENT
TRANSIT ACCESS**

16%

How is it measured?

Step 1

ESRI Community Analyst counts households in poverty and the non-white or Hispanic individuals within a 1/2 mile walk of stops on bus routes that run at least every 15 minutes.

Step 2

ESRI Community Analyst counts the same population in the MPO's metropolitan planning area.

Step 3

The regional population is divided by the EJ population from Step 1.

Objective 4A

PM1

Number of People in Central Indiana with Access to Higher Education Facilities by Fixed-Route Transit

Higher education is a means to opportunity and generally higher wages. Transportation can be a factor that limits access to higher education for people. Central Indiana is defined as the 9-county Central Indiana region, fixed-route transit is service from IndyGo and Access Johnson County, and higher education facilities are junior colleges, colleges, and universities.

Data

611K

**PEOPLE HAVE ACCESS TO HIGHER
EDUCATION FACILITIES AND
TRAINING CENTERS BY TRANSIT
(34% OF CENTRAL INDIANA)**

84%

**OF HIGHER EDUCATION
FACILITIES ARE ACCESSIBLE
BY FIXED-ROUTE TRANSIT**

How is it measured?

A half-mile buffer is drawn around all road links with transit. This is overlaid with Transportation Analysis Zone demographic data to calculate the population within the buffer. This data is overlaid with InfoUSA data, which displays all higher education facilities within the MPO counties (including Madison County).

Objective 4A

PM2

Automobile Accessibility Index

The Automobile Accessibility Index is the percentage of households in Central Indiana (9-county region) that can reach a job within a 30-minute car trip during peak morning travel.

Data

99.5%

OF CENTRAL INDIANA'S HOUSEHOLDS CAN REACH A JOB BY AUTOMOBILE IN 30 MINUTES

How is it measured?

The **Dark zone** can access the **light zones** in 30 minutes by car. Total the jobs in **light zones** and average by population in the **dark zone**.

Objective 3B

PM2

Transit Job Accessibility Index

The Transit Job Accessibility Index is the percentage of households in Central Indiana (9-county region) that can reach a job within a 60-minute transit trip during peak morning travel.

Data

42%

OF CENTRAL INDIANA'S HOUSEHOLDS CAN REACH A JOB BY TRANSIT IN 60 MINUTES

How is it measured?

The **Dark zone** can access **light zones** in 60 minutes by bus. Total the jobs in **light zones** and average by population in the **dark zone**.

Objective 7C

PM1

Percentage of Pavement on Major Roads in the Region in Poor Condition

Measurement of major regional roadways' pavement condition is an important performance measure that affects safety and efficiency of surface transportation facilities.

Data

GOOD
60.47% 60.47% of road pavement is in Good condition.

FAIR
25.49% 25.49% of road pavement is in Fair condition.

POOR
13.87% 13.87% of road pavement is in Poor condition.

NO SCORE
0.17% 0.17% of road pavement has no score.

How is it Measured?

The City of Indianapolis uses the Pavement Condition Index (PCI), which rates pavement condition on a 0 to 100 point scale. Other local governments in the MPO's metropolitan planning area use the Pavement Surface Evaluation and Rating (PASER) measure, which rates condition on a 0 to 10 point scale. A breakdown of how the scores were distributed between the categories is listed below:

Good: A PCI of 56 or greater; A PASER of 6 or greater

Fair: A PCI between 41 to 55; A PASER of 4 to 5

Poor: A PCI between 1 to 40; A PASER of 1 to 3

Objective 7A

PM3

Percentage of Non-NHS Bridges in Poor Condition

This performance measure examines bridges off* the National Highway System, providing a comprehensive overview of bridges in Central Indiana (8-county region). "Poor condition" is defined by the federal rule governing this performance measure.

* Condition of bridges on the National Highway System are measured by INDOT.

Data

GOOD
46.48% 46.48% of all non-NHS bridge surface area in Central Indiana is in good condition.

FAIR
48.33% 48.33% of all non-NHS bridge surface area in Central Indiana is in fair condition.

POOR
5.20% 5.2% of all non-NHS bridge surface area in Central Indiana is in poor condition.

How is it Measured?

Counties regularly inspect and rate bridges. They report that data to the National Bridge Inventory. For this measure, the MPO compares the square meter area of non-NHS bridges in poor condition to the total area of all non-NHS bridges.

Objective 8A

PM1

Land Consumption

This measure allows us to track the expansion of the urbanized area and monitor how quickly greenfield development is converting open land into developed land.

Data

422K ACRES

OF DEVELOPED LAND IN THE MPO'S METROPOLITAN PLANNING AREA

How is it Measured?

Property class codes for parcels in the MPO's metropolitan planning area from the Indiana Department of Local Government Finance (DLGF) are used to identify vacant and developed parcels. The area of vacant parcels is then subtracted from the total land area.

For this measure agricultural (non-homestead) parcels are considered vacant.

Objective 9A

PM2

Number of Residents that can Access Grocery Stores by Bike, Sidewalk, or Transit

Access to healthy foods for people who don't have access to a car is an important quality of life indicator and social determinant of health. Grocery stores provide better access to healthy food choices than convenience or specialty food stores. Access means a half-mile walk (10 minute), 2.5 mile bike (15 minute), or half-mile (10 minute walk) to transit and from transit to a grocery store.

Data

TRANSIT

672K

672,217 residents can access a grocery store by fixed-route transit. 127,837 people have access on frequent routes.

BICYCLE

585K

585,105 residents can access a grocery store by bicycle.

WALKING

65K

65,263 residents can access a grocery store by walking.

How is it measured?

For each mode (bike, walking, transit)...

Map the infrastructure (bike path, sidewalk, transit route) and the grocery stores. Select those stores that are near the infrastructure.

Draw a buffer around those stores, representing how far you might travel by each mode to get there.

People inside the purple buffer, above, are close enough to access the sidewalk, bike path, or bus route, and they are close enough to get to the grocery store.
